For the Notre Dame Schedule app, I used several material design techniques to control the colors of various parts of the app. First, I have a super material theme that is the parent to both material theme styles (one for post version 21, and one for pre version 21). The file styles.xml contains the material theme for pre version 21, and this style sets the background color, text color, and button color for older versions of the app. This file also contains the toolbar theme and the popup theme, each setting the background colors and text colors of the toolbar in the main activity and the overflow menu containing the hidden buttons in that toolbar. The styles.xml file in the directory values-v21 contains another material theme, and this one specifies darker background and text colors for newer versions of the app.
